OVER FÆRØERNE

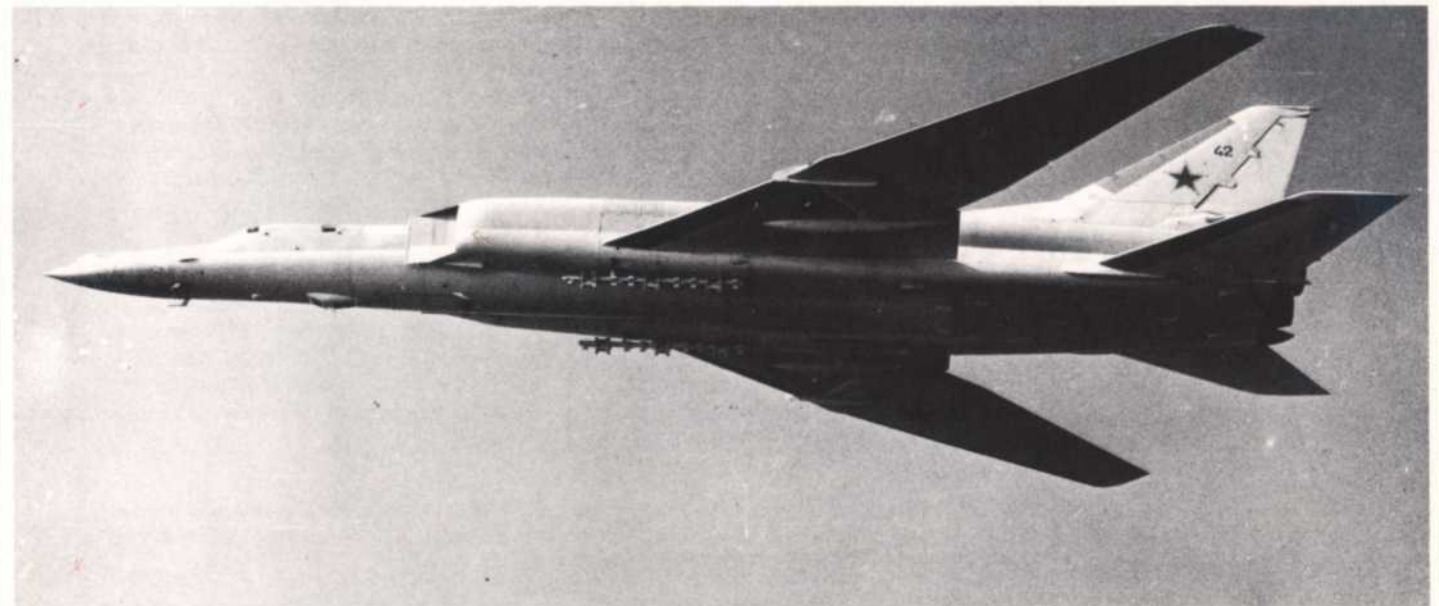

Russians over the Baltic

The Baltic skies are open to all nations and are regularly used by Russian and other Warsaw Pact operational aircraft. These pictures are a small selection taken at various times by Danish Air Force RF-35 Drakens and released to *Interavia*.

▲ Coot-A is the NATO name for the ECM or electronic intelligence gathering version of the Ilyushin Il-18 airliner. Major differences are the under-fuselage container housing side-looking radar and other sensors and the bulges on either side of the fuselage, also presumed to cover sensors.

◀ A distinctive shape over the Baltic is the Beriev M-12 Tchaika, twin turboprop, maritime reconnaissance amphibian, (NATO code name Mail), with its magnetic anomaly detector 'pole' extending the fuselage line and its prominent nose radome. Despite its appearance it holds numerous FAI records in its weight and class, both for altitude and speed.

▲ This Russian Naval Aviation Tupolev Tu-26 Backfire with its wings in the fully swept (55°) position has had the refuelling probe removed, but the mounting is visible above the nose. The rather 'lumpy' missile/stores/decoy (?) beams look out of place on such a high performance aircraft, but could be for multiple non-nuclear stand-off guided weapons. Backfire is credited by US sources with a combat radius of 5,500km (3,420mi). Its strategic potential was a major discussion point at the SALT 2 talks.

► The clean lines of the Tupolev Tu-22 Blinder show clearly in this plan view. The large undercarriage fairings are typical of the Tupolev bureau designs and may partly account for its reported disappointing unrefuelled combat radius of 3,100km/1,930mi (US source). The twin turbojets are thought to be rated at 27,000lb (12,500kg) with afterburner, giving a Mach 1.4 top speed at 40,000ft. Blinder A is a reconnaissance bomber, 'B' carries a 'Kitchen' air-to-surface missile recessed in the weapon bay, and the 'C' is a maritime
